1. Introduction

This report documents a full-stack Cloud Incident Monitoring and Response Platform built for B9IS109. The stack includes a JavaScript frontend, Node.js and Express backend, MongoDB Atlas, JWT authentication, Socket.IO, and AWS EC2 deployment.

2. Project Overview

Cloud teams need one register for incidents instead of scattered alerts. The project delivers login, dashboard, CRUD, search, webhooks, RBAC, and responsive UI as a complete web information system.

3. System Requirements

Functional: secure login, incident CRUD, search and filters, dashboard, webhook ingestion, timeline audit trail. Non-functional: Node.js, MongoDB Atlas, HTTP status codes, JWT and RBAC, responsive UI, cloud deployment, central error handling.

4. System Architecture

Client-server design (Fielding, 2000). Express exposes `/api/auth`, `/api/incidents`, `/api/observability`, `/api/cost`. Frontend uses Fetch API and Socket.IO. Production: Nginx, PM2, EC2, MongoDB Atlas.

5. Data Model

Incidents store incidentId, severity, status, provider, service, region, SLA fields, timeline, and comments. Users store hashed passwords and roles Guest, User, Administrator.

6. CRUD Operations

POST create returns 201. GET list and GET by id. PUT update and POST comments. DELETE admin

only. Socket.IO broadcasts changes.

7. Additional Features

Search, pagination, Chart.js dashboard, SLA timer, badges, JWT/RBAC, responsive CSS, theme toggle, real-time sync.

8. Testing and Validation

Manual tests for login, CRUD, RBAC, webhook, health endpoint, and Socket.IO. Automated Jest tests planned as future work.

9. External API Integration

Optional COST_API_URL for external billing JSON. Inbound webhook at /api/incidents/webhook with shared secret for cloud alerts.

10. Conclusion

The platform meets B9IS109 requirements with full incident CRUD, dashboards, security, and AWS deployment as a complete full-stack deliverable.

Reflective Learning Experience

The project connected frontend, API, and database into one system. EC2 deployment and Socket.IO were the main learning areas. I would add automated tests earlier next time.
